LIFE-CYCLE ASSESSMENT

The Life Cycle Analysis (LCA) that forms the basis of this Product Environmental Profile (PEP) was conducted in accordance with the guidelines specified by PCR-ed4-EN-2021 09 06 of the PEP ecopassport® Program. The functional unit and waste management scenarios align with the standards outlined in PSR-0011-ed2.0-EN-2023-06-06. The results were generated using the One Click LCA software and the Ecoinvent 3.10 database and EF 3.1.

CUT-OFF CRITERIA

The study does not exclude any modules or processes which are stated mandatory in the EN 50693 and the applied PCR. The study does not exclude any hazardous materials or substances.

The study includes all major raw material and energy consumption. All inputs and outputs of the unit processes, for which data is available for, are included in the calculation. There is no neglected unit process more than 1% of total mass or energy flows. The module specific total neglected input and output flows also do not exceed 5% of energy usage or mass.

MANUFACTURING AND PACKAGING (A1-A3)

The environmental impacts considered for the product stage cover the manufacturing of raw materials used in the production as well as packaging materials and other ancillary materials. Also, fuels used by machines, and handling of waste formed in the production processes at the manufacturing facilities are included in this stage. The study also considers the material losses occurring during the manufacturing processes as well as losses during electricity transmission.

Manufacturing of hydronic panel radiators from cold rolled steel coils. Main processes flow during production: pressing, welding, testing, painting, packaging. All components consumption declared in mass unit [kg]. Transportation distances for raw materials, packaging components, ancillary materials using during manufacturing process have been calculated as distances from suppliers warehouses to production site. Relevant manufacturing wastes (e.g. steel scraw) and their proper EoL scenarios have been included. Less relevant production wastes have been excluded from calculation accordingly to allowed cut-off criteria. Heat, electricity consumption for processes at the factory are calculated in MJ or kWh with allocation by mass of declared product unit.

TRANSPORT AND INSTALLATION (A4-A5)

Transportation of the product in its packaging from the manufacturer's last logistics platform (A4) to the distributor and from the distributor to the installation place (A5), as defined by PCR-ed4-EN-2021 09 06, covers fuel direct exhaust emissions, environmental impacts of fuel production, as well as related infrastructure emissions.

Products with unit packaging are transported to the customers on wooden pallets, mainly by lorries. The final installation (A5) sites are considered in France as determined by market analysis. Transportation distance is estimated as 1022 km, transportation method is lorry. Energy for diesel machinery during installation estimated as 0,19 kWh per product. The treatment of packaging waste is calculated with the scenario presented in PSR-0011-ed2.0-EN-2023-06-06 for France.

PRODUCT USE AND MAINTENANCE (B1-B7)

Not concerned. No energy or water consumption during B1-B7 stages. Air, soil, and water impacts during the use phase have not been studied.

PRODUCT END OF LIFE (C1-C4, D)

Electricity consumption associated with dismantling the radiator, transporting materials to processing sites, and the processing activities themselves are included in the evaluation. Consumption of energy during deconstruction is considered as 0,01 kWh per 1kg of product of diesel fuel used by machines.

It is assumed that the wastes are collected separately and transported by lorries to the waste treatment facilities at average distance 1000 km. The product's end of life is modelled using the scenario defined in PCR-ed4-EN-2021 09 06. Net benefits and beyond system boundary are also included in the PEP. Due to material and energy recovery potential of parts in the product and in the packaging, recycled raw materials lead to avoiding virgin material production and the energy recovered from incineration replaces energy and heat from primary sources. Benefits from incineration and recycling are included in module D. Loads are included in module C3.

HOMOGENEOUS ENVIRONMENTAL FAMILIES

The range of static hot water radiators Radson Integra Parada HP and Integra Parada Flex 8C consists of 1305 versions that belong to the same homogeneous environmental family: the products have the same function, are covered by the same product standards, and have identical manufacturing technology in terms of the type of materials and manufacturing processes. Only the weights and power outputs differ. The environmental impacts of the products in the range are estimated by scaling the environmental impacts of the reference product using extrapolation factors. The parameters of the various products and extrapolation factors for declared and functional unit in the range are presented below for different Integra Parada HP and Integra Parada Flex 8C versions.
